## TABLE OF CONTENTS

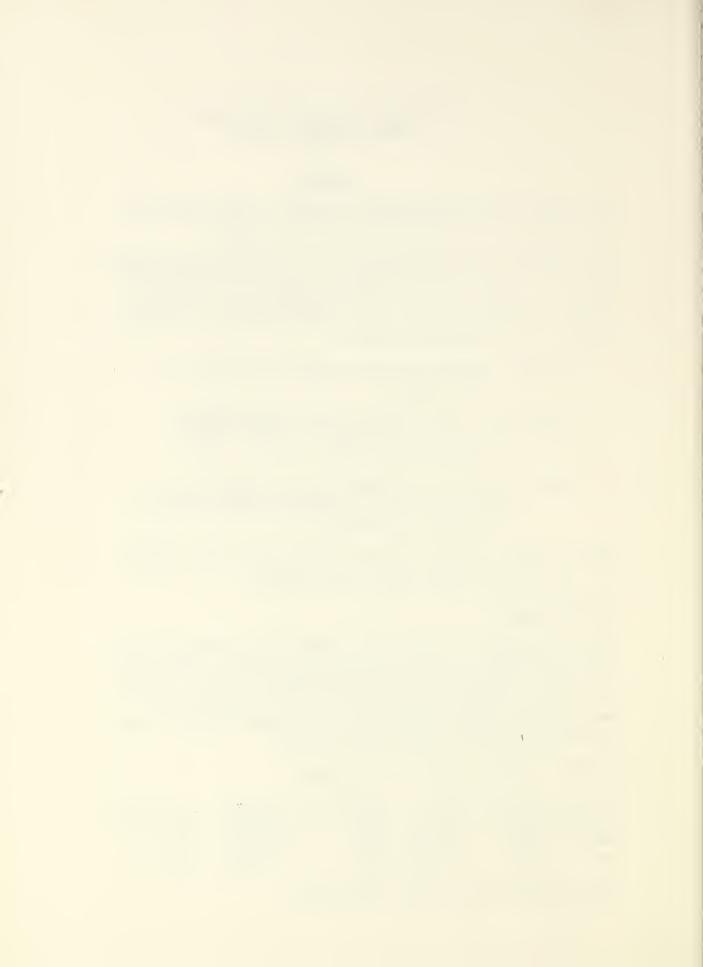

Introduction	1
Weather Summary	1
Observational Evaluations:	
Grasses, Legumes, and Herbaceous Plants	2-19
Shrubs and Trees	20-26
Progress Reports on Projects	27-31
Plant and Seed Increases	32 <b>-</b> 35
Notes and Special Problems	36
Combine Settings for Seed Harvest	36 <b>-</b> 37
Pure Seed and Germination Percentages	38
Information: Articles	38

Organization of the
Soil Conservation Service
Plant Materials Center
Coffeeville, Mississippi

## Plant Materials Center Staff

B. B. Billingsley, Jr., Manager
J. H. Adams Supervisory Biological Technician
Lillian J. Stebbing Clerk Stenographer
Oscar L. Chandler Farm Equipment Operator
Fred W. Jackson Farm Equipment Operator
Jimmie Miller Nursery Worker
James Smith

#### PART II -

### Progress Reports on Projects

1. Eleven accessions of daylilies, Hemoracallis spp., were being compared for density of ground cover, beauty of blossom, rate of spread, vigor, etc., MS 2165, which has been established in an increase production field, still appears to be best. It seems to produce slightly more blossoms and somewhat denser stand than any of the other daylilies. Ratings follow:

MS No.	Date :Planted		Leaf :Productio	Ability n:To Spread:	Winter Injury	Plant : Height:
2586	67	5	3	ς	7	21/21
2164	65	í	3	3	ī	31

2177	65	1	1	3	1	3 <del>1</del> 1
21.78	. 65	1	1	3	1	21/21
2338	66	1	3	3	1	2출1
2339	66	1	3	3	1	2 <u>1</u> 1
2438	<b>6</b> 6	3	3	3	1	21/21
2439	67	1	3	3	1	2 <del>1</del> 21
2562	67	1	3	3	1	2 <del>1</del> 21
2570	67	3	3	3	1	3 *

# 2. Panicum hemitomon, Maidencane

Two separate tests were being carried out on maidencane.

a. Eight accessions were being evaluated for rate of spread, height, density of stand, and other characteristics to be considered in streambank or reservoir levee erosion control. MS 2138, which had been previously selected, still looks best. They are evaluated as follows:

MS No.	Date :Planted	Stand 1:Rating	Leaf :Production	Ability :To Spread:	Winter Injury	
525	62	1	1.	3	1	31
2138	64	1	1	1	1	31
2139	64	1	3	. 1	1	32"
2390	66	1	5	3	1	26 <sup>11</sup>
2449	66	1	5	1	1	12"
2589	67	1	1	1	1	31
2642	67	1	5	5	1	20"
2908	68	1	3	3	1	30"

### 2. Panicum hemitomor, continued:

MS 2138 produces a very dense stand and remains green longer in the fall than do most of the other accessions.

b. A test to determine (1) the best month(s) to plant and (2) whether shipping is detrimental to maidencane was continued in 1970. Plantings were to be made for 24 consecutive months, but bad weather prevented plantings from being made for three months during this period.

Rhizomes were dug each month. Some were planted immediately and others were packaged as for shipment and stored in the warehouse. Plantings were made from this stored material after 24 hours and again after 48 hours. The following data was recorded:

- (1) Initial survival
- (2) Percent ground cover one year after planting
- (3) Width of spread one year after planting.

The test is not yet complete. There appears to be very little difference in survival, spread, etc., whether material is planted immediately or held for 24 or 48 hours. Weather in January, February, and March 1970 was such that the material was not planted. All material planted in October, November, and December, 1969, had very poor survival.

- 3. A three-year test designed to determine the best depth and month(s) to plant five species of plants was continued in 1970. One hundred seeds were planted monthly at 0",  $\frac{1}{4}"$ ,  $\frac{1}{2}"$ , 1" and  $1\frac{1}{2}$ " depths. The test is not yet complete but certain observations are shown below:
  - a. Echinochloa holubii, Limpopograss, MS 924

Generally germination at the 1/4" to 1/2" depth has been best. Survival has been rather constant at all depths of planting but is quite poor from plantings made between October and April.

- b. <u>Lespedeza virgata</u>, Spreading lespedeza, MS 126

  Germination has been better at the O", 1/4" and 1/2" planting depths. Survival has been rather constant at all depths. Germination by months has been quite erratic.
- c. Panicum virgatum, Pangburn switchgrass, MS 155

  Germination has been best at the 1/4", 1/2" and 1"

  depths but has been variable. Survival at various depths of planting has likewise varied considerably.
- d. Paspalum notatum, Wilmington bahiagrass, MS 131

  Germination was best at the  $1/2^n$ ,  $1^n$ , and  $1\frac{1}{2}^n$  planting depths. Survival generally has been poor at all depths, especially at the  $0^n$  and  $1/4^n$  ones.
- 4. Two species of plants, Spartina patens, MS 2360, and Phalaris arundinacea, MS 540, were planted vegetatively in rows grading from 6° above water to a 6° depth of water. This was done to determine whether there would be an increase in seed production at some point along the row. Both plantings were destroyed in 1970 as seed production was consistently very poor along the entire row.
- 5. Eight accessions of fescue were planted in 5' x 20' blocks in October 1967. These have been compared for their ability to form sod and for summer growth. They are listed below in order, most to least promising:

# Festuca arundinacea:

Variety	MS No.
KY 31	160 <b>1</b>
Artrens	539
Goar	26 <b>56</b>
Arflag	538
Alta	2658
Uruguay	2329
Fawn	26 57
Kenwell	26 59

- 6. Four accessions of Lespedeza japonica, MS Nos. 1643, 1850, 2503, and 2536 have been clipped twice annually for two years. This clipping regime was initiated to determine whether any of the plants (1) would spread and produce more and finer stems, suitable for hay, and (2) could withstand the clipping. None of the four appear to hold much promise.
- 7. Four species of plants were planted in a stream channel near Coffeeville in 1966 to test their potential as streambank erosion control plants. All four have remained and have shown some merit. Listed below are the plants and some general notes about each:
  - a. Echinochloa holubii, Limpopograss, MS 924

A good stand still persists and it is spreading, though not too fast (about a  $2\frac{1}{2}$  spread). Silt is building up behind grass but washing is occurring between the grass and water.

b. Panicum hemitomon, Maidencane, MS 2138

A good stand persists and plants have spread to a 5 - 6' width. Sloughing soil, together with native plants, are coming in behind. This is the best looking plant on this particular site.

c. Salix hastata, Halberd willow, MS 863

A good stand still persists and silt has built up within it. Sloughing soil catches behind plants and native plants are coming in there.

d. Salix interior, Sandbar willow, MS 880

A good stand remains though it is not as dense as that of Halberd willow. Individual plants are taller than Halberd willows. Again, sloughing soil is being trapped behind plants and natives are invading the area.

8. Seven accessions of Paspalum distichum, knotgrass, and three accessions of Paspalum vaginatum, seashore paspalum, were planted in 5' x 20' plots in 1970. These plants are being evaluated for possible use as streambank or reservoir levee control plants.

4-21025 6-71

The following are the principal characteristics being compared:

- a. Rate of spread,
- b. Density of stand
- c. Seed production; specifically, the amount which can be mechanically harvested.
- d. Disease and insect resistance.

### Notes and Special Problems

1. Karmex DL (Diuron) 28% active ingredient was applied at recommended rates on several fields of perennial grasses in March, 1970. These fields had been burned off to remove dead material. A certain amount of ash, plus dead vegetation, remained at the time of application, although rains had removed much of the ash.

Control of crabgrass and other annual grasses was very poor. Possibly the dead vegetation and small amount of ash remaining caused the Karmex to be ineffective.

2. A production field of maidencane, Panicum hemitomon, appeared to suffer rather severe winter injury in 1970. This field is quite sandy. Maidencane growing in a heavy soil showed no such injury.

## Combine Settings for Seed Harvest

### Echinochloa frumentacea Chiwapa japanese millet

Cylinder speed - 1200 -- 1400 RPM
Cylinder to concave spacing - 1/4" - 1/2"
Fan valves - 1/3 open
Adj. chaffer - 1/2 open
Finishing sieve - 9/64"

# Glycine ussuriensis Wild reseeding soybean

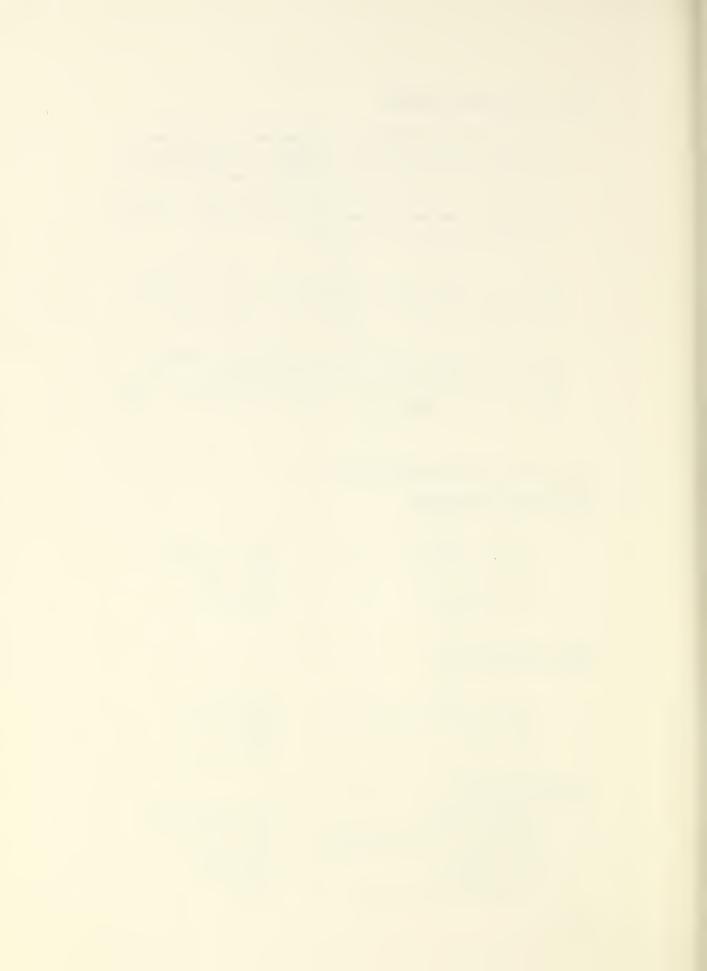

Cylinder speed - 960 RPM
Cylinder to concave spacing - 5/8" - 1/2"
Fan Valves - Open
Adj. chaffer - 1/2 open

# Lespedeza virgata

Spreading lespedeza
Cylinder speed - 1000 - 1200 RPM
Cylinder to concave spacing - 1/\(\psi^\pi\) - 1/2"

Fan valves - 1/\(\pi\) open
Adj. chaffer - 1/2 open
Finishing sieve - 9/6\(\pi\)"
